

Diksuchi-AI

Voice-first documentation intelligence for operators,
maintainers, and trainees

Built by Navmate Private Limited • Made in India

Made with **GAMMA**

Navmate — Sovereign AI for Mission-Critical Environments

What We Build

AI and data systems for sensitive, regulated environments requiring data sovereignty and auditability

Who We Build For

Defence, government, and strategic infrastructure organisations with zero-tolerance for external dependencies

How We Build

On-premise, air-gap capable systems with no foreign cloud or API dependency in the data path

Where We Are

Indian deep-tech company, building mission-critical AI solutions for sovereign operations

The Answer Is in the Manual. Finding It Shouldn't Be the Bottleneck.

Operator in the Field

One specific procedure buried inside hundreds of pages across multiple handbooks. Time-sensitive, location-constrained, needs instant access.

Maintainer on the Bay

One torque value, one safety warning, one sequence required now. Hands busy on equipment, eyes on the system, zero room for error.

Trainee Learning the System

Hundreds of pages of English documentation while thinking in Hindi, Telugu, or Tamil. Language barrier slowing critical knowledge transfer.

⚠ The cost: lost minutes per query, occasional wrong-step errors, and slow ramp-up for every new technician. Small errors compound in safety-critical domains.

Ask Any Manual. By Voice. In Your Language. Get the Exact Answer with the Exact Page.

The Promise

Load your manuals once. Anyone in your organisation can ask a question by voice or text, in their preferred language, and receive a precise, cited answer with the relevant diagram — in seconds.

Three Guarantees

1. The answer appears in **their own language**, with safety warnings surfaced before procedures
2. The **diagram** from the manual is embedded directly in the reply
3. A **clickable citation** opens the original document at the exact page

Where It Runs: Entirely on the customer's own hardware. No data ever leaves the secure boundary.

From Question to Answer, in Seconds

01

Pick a System

Select from available documentation, e.g., "PALM-120 — Operator Handbook"

02

Ask in Your Language

Type or hold-to-talk the microphone button with your question

03

Get the Answer

Receive a complete answer in your language with warning surfaced first

04

See the Diagram

Relevant diagram pulled from the manual and embedded in the reply

05

Verify the Source

One click opens the PDF at the exact page for validation

06

Listen Back

Play the entire answer as audio for hands-free operation

Every decision built around the reality that users are rarely sitting at a desk.

14 Languages. Voice In. Voice Out.

Voice Input

User speaks naturally in their language. The system understands context, technical terms, and identifiers.

Translation Engine

Fourteen languages live today: English, Hindi, Bengali, Tamil, Telugu, Marathi, Gujarati, Kannada, Malayalam, Punjabi, Assamese, Nepali, Sanskrit, Hebrew.

Voice Output

Answer spoken back in the same language with clear, named voice. Part numbers and technical terms preserved exactly.

- ① Part numbers, NSNs, model designations, and acronyms (PALM-120, RPM, ECM) are reproduced character-for-character — never translated, never paraphrased.

Warnings First. Specs Exact. Sources Cited.

Rule 1: Warnings Come First

Every WARNING, CAUTION, or NOTE from the source manual is surfaced before the procedure step it applies to. Always. The operator never sees a step without the warning that protects them.

Rule 2: Specifications Are Exact

Torque values, tolerances, and clearances are reproduced byte-for-byte. If the manual says 27.5 Newton-metres, the answer says 27.5 Newton-metres. Never rounded, never paraphrased.

Rule 3: Every Claim Is Cited

No bare statements allowed. Every answer carries a clickable reference to the exact page of the source document. Users verify any answer with a single click.

A defence-grade assistant cannot afford a confident wrong answer. Safety, not fluency, is the first priority.

Runs on a Server. Runs on a Base. Runs Air-Gapped.

Single-Server

Workstation-class machine with GPU, sufficient for a unit or small detachment. Self-contained, easy deployment.

On-Base Cluster

Split across multiple hosts for larger installations. Scales horizontally, load-balanced, enterprise-grade.

Air-Gapped

Fully disconnected deployment with no network connectivity. Models pre-loaded, operates in complete isolation.

- ❑ No foreign cloud. No foreign API. No data ever leaves the customer boundary. Multi-tenant support inside one deployment — separate units, teams, and document sets hard-isolated at the database level.

From Minutes of Search to Seconds of Answer

Operators in the Field

The right procedure, the right warning, the right diagram — in their language, in seconds. Hands-free when needed. Context-aware responses tailored to their current system.

Trainees and New Recruits

Self-paced learning on the real manuals. The assistant explains in their language. Trainers can review every interaction and track knowledge gaps.

Maintainers on the Bay

One spoken question replaces minutes of page-flipping. Specifications returned exact. The diagram appears inline. Torque values, tolerances, sequences — all precise and cited.

Commanders and Supervisors

Faster operations, fewer documentation-related errors, every answer cited and auditable. Complete visibility into how documentation is accessed and understood.

A Smart Assistant That Has Read Every Manual

Thank you.
